Super Reduced String

Steve has a string of lowercase characters in range <code>ascii['a'..'z']</code>. He wants to reduce the string to its shortest length by doing a series of operations. In each operation he selects a pair of adjacent lowercase letters that match, and he deletes them. For instance, the string <code>aab</code> could be shortened to <code>b</code> in one operation.

Steve's task is to delete as many characters as possible using this method and print the resulting string. If the final string is empty, print Empty String

Function Description

Complete the *superReducedString* function in the editor below. It should return the super reduced string or **Empty String** if the final string is empty.

superReducedString has the following parameter(s):

• s: a string to reduce

Input Format

A single string, s.

Constraints

• $1 \le |s| \le 100$

Output Format

If the final string is empty, print Empty String; otherwise, print the final non-reducible string.

Sample Input 0

aaabccddd

Sample Output 0

abd

Explanation 0

Steve performs the following sequence of operations to get the final string:

aaabccddd → abccddd → abddd → abd

Sample Input 1

aa

Sample Output 1

Empty String

Explanation 1

aa → Empty String				
Sample Input 2				
baab				
Sample Output 2				
Empty String				

Explanation 2

 $baab \rightarrow bb \rightarrow Empty String$
